## **BACKGROUND**

Growth factor/mitogenic activation of the phosphatidylinositol 3-kinase (PI3K)/AKT signalling pathway ultimately leads to the key cell cycle and growth control regulator mTOR, the mammalian target of rapamycin (alternatively referred to as FRAP (FKBP12 and rapamycin associated protein), RAFT1 (rapamycin and FKBP12 target 1), RAPT1 (rapamycin target 1)—all derived from the interaction with the FK-506-binding protein FKBP12, and SEP (sirolimus effector protein)). mTOR is a mammalian serine/threonine kinase of approximately 289 kDa in size and a member of the evolutionary conserved eukaryotic TOR kinases (refs. 1-4). The mTOR protein is a member of the PI3-kinase like kinase (PIKK) family of proteins due to its C-terminal homology (catalytic domain) with PI3-kinase and the other family members, e.g. DNA-PKcs (DNA dependent protein kinase), ATM (Ataxia-telangiectasia mutated). In addition to a catalytic domain in the C-terminus, mTOR contains a FKBP12/rapamycin complex binding domain (FRB). At the N-terminus up to 20 HEAT (Huntingtin, EF3, alpha regulatory subunit of PP2A and TOR) motifs are found whilst more C-terminal is a FAT (FRAP-ATM-TRRAP) domain, and at the extreme C-terminus of the protein an additional FAT domain is found (FAT-C) (refs. 5,6).

TOR has been identified as a central regulator of both cell growth (size) and proliferation, which is in part governed by translation initiation. TOR dependant phosphorylation of S6-kinase (S6K1) allows translation of ribosomal proteins involved in cell cycle progression (refs. 7-9). Cap-dependant translation is regulated by the phosphorylation of the eukaryotic translation initiation factor 4E (eIF4E)-binding protein 1 (4E-BP1 (PHAS-1)). This modification prevents PHAS-1 binding eIF4E, thereby permitting formation of an active eIF4F translation complex (reviewed in refs. 10, 11, 12). Activation of these signalling elements is dependant on insulin, other growth factors and nutrients suggesting a gate-keeper role for mTOR in the control of cell cycle progression only under favourable environmental conditions. The PI3K/AKT signalling cascade lies upstream of mTOR and this has been shown to be deregulated in certain cancers and results in growth factor independent activation in, for example, PTEN deficient cells. mTOR lies at the axis of control for this pathway and inhibitors of this kinase (e.g. sirolimus (rapamycin or Rapamune™) and everolimus (RAD001 or Certican™)) are already approved for immunosuppression and drug eluting stents (reviewed in refs. 13, 14), and are now receiving particular interest as novel agents for cancer treatment.

Tumour cell growth arises from the deregulation of normal growth control mechanisms such as the loss of tumour sup-

pressor function(s). One such tumour suppressor is the phosphatase and tensin homologue deleted from chromosome ten (PTEN). This gene, also known as mutated in multiple advanced cancers (MMAC), has been shown to play a significant role in cell cycle arrest and is the most highly mutated tumour suppressor after p53. Up to 30% of glioblastoma, endometrial and prostate cancers have somatic mutations or deletions of this locus (refs. 15, 16).

PI3K converts phosphatidylinositol 4,5, bisphosphate (PIP2) to phosphatidylinositol 3,4,5, triphosphate (PIP3) whilst PTEN is responsible for removing the 3' phosphate from PIP3 producing PIP2. PI3-K and PTEN act to maintain an appropriate level of PIP3 which recruits and thus activates AKT (also known as PKB) and the downstream signalling cascade that is then initiated. In the absence of PTEN, there is inappropriate regulation of this cascade, AKT becomes effectively constitutively activated and cell growth is deregulated. An alternative mechanism for the deregulation of this cell signalling process is the recent identification of a mutant form of the PI3K isoform, p110alpha (ref. 17). The apparent increased activity of this mutant is thought to result in increased PIP3 production, presumably in excess of that which the function of PTEN can counteract. Increased signalling from PI3K, thus results in increased signalling to mTOR and consequently, its downstream activators.

In addition to the evidence linking mTOR with cell cycle regulation (from G1 to S-phase) and that inhibition of mTOR results in inhibition of these regulatory events it has been shown that down regulation of mTOR activity results in cell growth inhibition (Reviewed in refs. 7, 18, 19). The known inhibitor of mTOR, rapamycin, potently inhibits proliferation or growth of cells derived from a range of tissue types such as smooth muscle, T-cells as well as cells derived from a diverse range of tumour types including rhabdomyosarcoma, neuroblastoma, glioblastoma and medulloblastoma, small cell lung cancer, osteosarcoma, pancreatic carcinoma and breast and prostate carcinoma (reviewed in ref 20). Rapamycin has been approved and is in clinical use as an immunosuppressant, its prevention of organ rejection being successful and with fewer side effects than previous therapies (refs. 20, 21). Inhibition of mTOR by rapamycin and its analogues (RAD001, CCI-779) is brought about by the prior interaction of the drug with the FK506 binding protein, FKBP12. Subsequently, the complex of FKBP12/rapamycin then binds to the FRB domain of mTOR and inhibits the downstream signalling from mTOR.

The potent but non-specific inhibitors of PI3K, LY294002 and wortmannin, also have been shown to inhibit the kinase function of mTOR but act through targeting the catalytic domain of the protein (ref 21). Further to the inhibition of mTOR function by small molecules targeted to the kinase domain, it has been demonstrated that kinase dead mTOR cannot transmit the upstream activating signals to the downstream effectors of mTOR, PHAS-1 or p70S6 kinase (ref 22). It is also shown that not all functions of mTOR are rapamycin sensitive and this may be related to the observation that rapamycin alters the substrate profile of mTOR rather than inhibiting its activity per se (ref 23). Analysis of the interactions of mTOR with other cellular factors has revealed that in addition to the mTOR-Raptor complex, there is also an mTOR-Rictor complex representing a rapamycin insensitive activity of mTOR (B) (Sarbasov et al. *Current Biology* (2004) 14, 1296-1302). This activity likely accounts for the discrepancy between kinase dead mTOR and the alteration of mTOR signalling by rapamycin and its derivatives. The discrepancy also identifies the possibility of a therapeutic advantage in inhibiting directly the catalytic activity of mTOR. It has been suggested that a catalytic inhibitor of mTOR may be a more

effective antagonist of cancer cell proliferation and survival and that rapamycin may be more useful in combination with agents that can compensate for its failure to completely disrupt pathway signalling (Choo and Blenis, *Cancer Cell* (2006) 9, 77-79; Hay, *Cancer Cell* 12(2005) 8, 179-183). Therefore, it is proposed that a kinase domain directed inhibitor of mTOR may be a more effective inhibitor of mTOR.

In addition to rapamycin's ability to induce growth inhibition (cytostasis) in its own right, rapamycin and its derivatives have been shown to potentiate the cytotoxicity of a number of chemotherapies including cisplatin, camptothecin and doxorubicin (reviewed in ref. 20). Potentiation of ionising radiation induced cell killing has also been observed following inhibition of mTOR (ref 24). Experimental and clinical evidence has shown that rapamycin analogues are showing evidence of efficacy in treating cancer, either alone or in combination with other therapies (see refs. 10, 18, 20). These findings suggest that pharmacological inhibitors of mTOR kinase should be of therapeutic value for treatment of the various forms of cancer comprising solid tumours such as carcinomas and sarcomas and the leukaemias and lymphoid malignancies. In particular, inhibitors of mTOR kinase should be of therapeutic value for treatment of, for example, cancer of the breast, colorectum, lung (including small cell lung cancer, non-small cell lung cancer and bronchioalveolar cancer) and prostate, and of cancer of the bile duct, bone, bladder, head and neck, kidney, liver, gastrointestinal tissue, oesophagus, ovary, pancreas, skin, testes, thyroid, uterus, cervix and vulva, and of leukaemias (including ALL and CML), multiple myeloma and lymphomas.

Renal cell carcinoma in particular, has been identified as sensitive to the rapamycin derivative CCI-779, resulting from a loss of VHL expression (Thomas et al. *Nature Medicine* (2006) 12, 122-127). Tumours that have lost the promyelocytic leukaemia (PML) tumour suppressor, have also been shown to be sensitive to inhibition of mTOR by rapamycin as a consequence of disruption of the regulation of the mTOR signalling pathway (Bernadi, *Nature* (2006) 442, 779-785) and the use of an mTOR kinase inhibitor in these diseases should be of therapeutic value. These latter examples in addition to those of PTEN deficiency or PI3K mutation indicate where a targeted approach to the use of mTOR inhibitors may prove particularly effective due to an underlying genetic profile, but are not considered to be exclusive targets.

Recent studies have revealed a role for mTOR kinase in other diseases (Easton & Houghton, *Expert Opinion on Therapeutic Targets* (2004) 8, 551-564). Rapamycin has been demonstrated to be a potent immunosuppressant by inhibiting antigen-induced proliferation of T cells, B cells and antibody production (Sehgal, *Transplantation Proceedings* (2003) 35, 7S-14S) and thus mTOR kinase inhibitors may also be useful immunosuppressives. Inhibition of the kinase activity of mTOR may also be useful in the prevention of restenosis, that is the control of undesired proliferation of normal cells in the vasculature in response to the introduction of stents in the treatment of vasculature disease (Morice et al., *New England Journal of Medicine* (2002) 346, 1773-1780). Furthermore, the rapamycin analogue, everolimus, can reduce the severity and incidence of cardiac allograft vasculopathy (Eisen et al., *New England Journal of Medicine* (2003) 349, 847-858). Elevated mTOR kinase activity has been associated with cardiac hypertrophy, which is of clinical importance as a major risk factor for heart failure and is a consequence of increased cellular size of cardiomyocytes (Tee & Blenis, *Seminars in Cell and Developmental Biology* (2005) 16, 29-37). Thus

mTOR kinase inhibitors are expected to be of value in the prevention and treatment of a wide variety of diseases in addition to cancer.

The vast majority of mTOR pharmacology to date has focused on inhibition of mTOR via rapamycin or its analogues. However, as noted above, the only non-rapamycin agents that have been reported to inhibit mTOR's activity via a kinase domain targeted mechanism are the small molecule LY294002 and the natural product wortmannin (ref 21).

 O<sub>1</sub>S<sub>1</sub>: oxathiole (C<sub>5</sub> ie 5 membered) and oxathiane (thioxane) (C<sub>6</sub> ie 6 membered); and,  
 N<sub>1</sub>O<sub>1</sub>S<sub>1</sub>: oxathiazine (C<sub>6</sub> ie 6 membered).

Examples of substituted (non-aromatic) monocyclic heterocyclyl groups include those derived from saccharides, in cyclic form, for example, furanoses (C<sub>5</sub> ie 5 membered), such as arabinofuranose, lyxofuranose, ribofuranose, and xylofuranose, and pyranoses (C<sub>6</sub> ie 6 membered), such as allopyranose, altropyranose, glucopyranose, mannopyranose, gulopyranose, idopyranose, galactopyranose, and talopyranose.

Spiro-C<sub>3-7</sub> cycloalkyl or heterocyclyl: The term “spiro C<sub>3-7</sub> cycloalkyl or heterocyclyl” as used herein, refers to a C<sub>3-7</sub> cycloalkyl or C<sub>3-7</sub> heterocyclyl ring (3 to 7 membered) joined to another ring by a single atom common to both rings.

C<sub>5-20</sub> aryl: The term “C<sub>5-20</sub> aryl” as used herein, pertains to a monovalent moiety obtained by removing a hydrogen atom from an aromatic ring atom of a C<sub>5-29</sub> aromatic compound, said compound having one ring, or two or more rings (e.g., fused), and having from 5 to 20 ring atoms, and wherein at least one of said ring(s) is an aromatic ring. Preferably, each ring has from 5 to 7 ring atoms.

The ring atoms may be all carbon atoms, as in “carboaryl groups” in which case the group may conveniently be referred to as a “C<sub>5-20</sub> carboaryl” group.

Examples of C<sub>5-20</sub> aryl groups which do not have ring heteroatoms (i.e. C<sub>5-20</sub> carboaryl groups) include, but are not limited to, those derived from benzene (i.e. phenyl) (C<sub>6</sub>), naphthalene (C<sub>10</sub>), anthracene (C<sub>14</sub>), phenanthrene (C<sub>14</sub>), and pyrene (C<sub>16</sub>).

Alternatively, the ring atoms may include one or more heteroatoms, including but not limited to oxygen, nitrogen, and sulfur, as in “heteroaryl groups”. In this case, the group may conveniently be referred to as a “C<sub>5-20</sub> heteroaryl” group, wherein “C<sub>5-20</sub>” denotes ring atoms, whether carbon atoms or heteroatoms (or otherwise referred to as a 5 to membered heteroaryl group). Preferably, each ring has from 5 to 7 ring atoms, of which from 1 to 4 are ring heteroatoms. Commonly, heteroatoms are selected from oxygen, nitrogen or sulphur.

Examples of C<sub>5-20</sub> heteroaryl groups include, but are not limited to, C<sub>5</sub> heteroaryl groups (5 membered heteroaryl groups) derived from furan (oxole), thiophene (thiole), pyrrole (azole), imidazole (1,3-diazole), pyrazole (1,2-diazole), triazole, oxazole, isoxazole, thiazole, isothiazole, oxadiazole,

The heteroaryl group may be bonded via a carbon or hetero ring atom.

Examples of  $C_{5-20}$  heteroaryl groups which comprise fused rings, include, but are not limited to,  $C_9$  heteroaryl groups (9 membered heteroaryl groups) derived from benzofuran, isobenzofuran, benzothiophene, indole, isoindole;  $C_{10}$  heteroaryl groups (10 membered heteroaryl groups) derived from quinoline, isoquinoline, benzodiazine, pyridopyridine;  $C_{14}$  heteroaryl groups (14 membered heteroaryl groups) derived from acridine and xanthene.

Includes Other Forms

Included in the above are the well known ionic, salt, solvate, and protected forms of these substituents. For example, a reference to carboxylic acid ( $-COOH$ ) also includes the anionic (carboxylate) form ( $-COO^-$ ), a salt or solvate

thereof, as well as conventional protected forms. Similarly, a reference to an amino group includes the protonated form ( $\text{—N}^+\text{R}^1\text{R}^2$ ), a salt or solvate of the amino group, for example, a hydrochloride salt, as well as conventional protected forms of an amino group. Similarly, a reference to a hydroxyl group also includes the anionic form ( $\text{—O}^-$ ), a salt or solvate thereof, as well as conventional protected forms of a hydroxyl group.

#### Isomers, Salts, Solvates, Protected Forms, and Prodrugs

Certain compounds may exist in one or more particular geometric, optical, enantiomeric, diastereomeric, epimeric, stereoisomeric, tautomeric, conformational, or anomeric forms, including but not limited to, *cis*- and *trans*-forms; *E*- and *Z*-forms; *c*-, *t*-, and *r*-forms; *endo*- and *exo*-forms; *R*-, *S*-, and *meso*-forms; *D*- and *L*-forms; *d*- and *l*-forms; (+) and (−) forms; *keto*-, *enol*-, and *enolate*-forms; *syn*- and *anti*-forms; *synclinal*- and *anticlinal*-forms;  $\alpha$ - and  $\beta$ -forms; *axial* and *equatorial* forms; *boat*-, *chair*-, *twist*-, *envelope*-, and *halfchair*-forms; and combinations thereof, hereinafter collectively referred to as “isomers” (or “isomeric forms”).

If the compound is in crystalline form, it may exist in a number of different polymorphic forms. For example, for Example 1a was isolated as Form A: 2-Theta° 6.9 (46%), 8.53 (100%), 10.1 (21%), 10.86 (24%), 11.65 (11%), 13.31 (14%), 13.75 (7%), 14.37 (54%), 15.21 (5%), 16.19 (13%), 16.81 (39%), 17.19 (40%), 17.97 (21%), 18.41 (65%), 18.78 (80%), 20.66 (8%), 21.07 (89%), 22.05 (19%), 22.36 (42%), 24 (7%), 24.36 (33%), 25.25 (31%), 25.54 (16%), 26.92 (18%), 27.26 (8%), 28.03 (8%), 28.39 (21%), 29 (8%), 29.91 (13%), 30.62 (23%), 31.48 (9%), 32.72 (5%), 33.27 (11%), 34.88 (4%), 35.48 (5%), 36.16 (4%), 36.88 (4%), 37.37 (4%), 37.91 (6%), 38.65 (4%) and 39.83 (4%). A less stable form, Form B, has also been isolated from water/THF: 2-Theta° 3.67 (7%), 7.28 (7%), 8.52 (7%), 9.22 (30%), 11.42 (78%), 12.69 (24%), 13 (15%), 13.41 (44%), 13.6 (26%), 14.51 (19%), 15.56 (13%), 16.25 (9%), 17.11 (13%), 17.55 (18%), 18.24 (64%), 18.59 (56%), 19.51 (33%), 19.85 (26%), 20.32 (13%), 21.49 (17%), 21.79 (13%), 22.23 (18%), 22.84 (26%), 23.72 (23%), 25.46 (74%), 26.1 (100%), 26.72 (43%), 27.94 (16%), 28.35 (8%), 34.74 (10%), 35.34 (6%), 36.72 (9%) and 38.55 (4%).

Note that, except as discussed below for tautomeric forms, specifically excluded from the term “isomers”, as used herein, are structural (or constitutional) isomers (i.e. isomers which differ in the connections between atoms rather than merely by the position of atoms in space). For example, a reference to a methoxy group,  $\text{—OCH}_3$ , is not to be construed as a reference to its structural isomer, a hydroxymethyl group,  $\text{—CH}_2\text{OH}$ . Similarly, a reference to *ortho*-chlorophenyl is not to be construed as a reference to its structural isomer, *meta*-chlorophenyl. However, a reference to a class of structures may well include structurally isomeric forms falling within that class (e.g.,  $\text{C}_{1-7}$  alkyl includes *n*-propyl and *isopropyl*; butyl includes *n*-, *iso*-, *sec*-, and *tert*-butyl; methoxyphenyl includes *ortho*-, *meta*-, and *para*-methoxyphenyl).

The above exclusion does not pertain to tautomeric forms, for example, *keto*-, *enol*-, and *enolate*-forms, as in, for example, the following tautomeric pairs: *keto/enol*, *imine/enamine*, *amide/imino alcohol*, *amidine/amidine*, *nitroso/oxime*, *thioketone/enethiol*, *N-nitroso/hydroxyazo*, and *nitro/aci-nitro*.

Note that specifically included in the term “isomer” are compounds with one or more isotopic substitutions. For example, H may be in any isotopic form, including  $^1\text{H}$ ,  $^2\text{H}$  (D), and  $^3\text{H}$  (T); C may be in any isotopic form, including  $^{12}\text{C}$ ,  $^{13}\text{C}$ , and  $^{14}\text{C}$ ; O may be in any isotopic form, including  $^{16}\text{O}$  and  $^{18}\text{O}$ ; and the like.

Unless otherwise specified, a reference to a particular compound includes all such isomeric forms, including (wholly or partially) racemic and other mixtures thereof. Methods for the preparation (e.g. asymmetric synthesis) and separation (e.g. fractional crystallisation and chromatographic means) of such isomeric forms are either known in the art or are readily obtained by adapting the methods taught herein, or known methods, in a known manner.

Unless otherwise specified, a reference to a particular compound also includes ionic, salt, solvate, and protected forms of thereof, for example, as discussed below, as well as its different polymorphic forms.

It may be convenient or desirable to prepare, purify, and/or handle a corresponding salt of the active compound, for example, a pharmaceutically-acceptable salt. Examples of pharmaceutically acceptable salts are discussed in ref. 25.

For example, if the compound is anionic, or has a functional group which may be anionic (e.g.,  $\text{—COOH}$  may be  $\text{—COO}^-$ ), then a salt may be formed with a suitable cation. Examples of suitable inorganic cations include, but are not limited to, alkali metal ions such as  $\text{Na}^+$  and  $\text{K}^+$ , alkaline earth cations such as  $\text{Ca}^{2+}$  and  $\text{Mg}^{2+}$ , and other cations such as  $\text{Al}^{3+}$ . Examples of suitable organic cations include, but are not limited to, ammonium ion (i.e.,  $\text{NH}_4^+$ ) and substituted ammonium ions (e.g.,  $\text{NH}_3\text{R}^+$ ,  $\text{NH}_2\text{R}_2^+$ ,  $\text{NHR}_3^+$ ,  $\text{NR}_4^+$ ). Examples of some suitable substituted ammonium ions are those derived from: ethylamine, diethylamine, dicyclohexylamine, triethylamine, butylamine, ethylenediamine, ethanolamine, diethanolamine, piperazine, benzylamine, phenylbenzylamine, choline, meglumine, and tromethamine, as well as amino acids, such as lysine and arginine. An example of a common quaternary ammonium ion is  $\text{N}(\text{CH}_3)_4^+$ .

If the compound is cationic, or has a functional group which may be cationic (e.g.,  $\text{—NH}_2$  may be  $\text{—NH}_3^+$ ), then a salt may be formed with a suitable anion. Examples of suitable inorganic anions include, but are not limited to, those derived from the following inorganic acids: hydrochloric, hydrobromic, hydroiodic, sulfuric, sulfurous, nitric, nitrous, phosphoric, and phosphorous. Examples of suitable organic anions include, but are not limited to, those derived from the following organic acids: acetic, propionic, succinic, glycolic, stearic, palmitic, lactic, malic, pantoic, tartaric, citric, gluconic, ascorbic, maleic, hydroxymaleic, phenylacetic, glutamic, aspartic, benzoic, cinnamic, pyruvic, salicylic, sulfanilic, 2-acetoxybenzoic, fumaric, toluenesulfonic, methanesulfonic, ethanesulfonic, ethane disulfonic, oxalic, isethionic, valeric, and gluconic. Examples of suitable polymeric anions include, but are not limited to, those derived from the following polymeric acids: tannic acid, carboxymethyl cellulose.

It may be convenient or desirable to prepare, purify, and/or handle a corresponding solvate of the active compound. The term “solvate” is used herein in the conventional sense to refer to a complex of solute (e.g. active compound, salt of active compound) and solvent. If the solvent is water, the solvate may be conveniently referred to as a hydrate, for example, a mono-hydrate, a di-hydrate, a tri-hydrate, etc.

It may be convenient or desirable to prepare, purify, and/or handle the active compound in a chemically protected form. The term “chemically protected form,” as used herein, pertains to a compound in which one or more reactive functional groups are protected from undesirable chemical reactions, that is, are in the form of a protected or protecting group (also known as a masked or masking group or a blocked or blocking group). By protecting a reactive functional group, reactions involving other unprotected reactive functional groups can be performed, without affecting the protected group; the protect-

63

ing group may be removed, usually in a subsequent step, without substantially affecting the remainder of the molecule. See, for example, ref 26.

For example, a hydroxy group may be protected as an ether ( $-\text{OR}$ ) or an ester ( $-\text{OC}(=\text{O})\text{R}$ ), for example, as: a t-butyl ether; a benzyl, benzhydryl (diphenylmethyl), or trityl (triphenylmethyl) ether; a trimethylsilyl or t-butyldimethylsilyl ether; or an acetyl ester ( $-\text{OC}(=\text{O})\text{CH}_3$ ,  $-\text{OAc}$ ).

For example, an aldehyde or ketone group may be protected as an acetal or ketal, respectively, in which the carbonyl group ( $>\text{C}=\text{O}$ ) is converted to a diether ( $>\text{C}(\text{OR})_2$ ), by reaction with, for example, a primary alcohol. The aldehyde or ketone group is readily regenerated by hydrolysis using a large excess of water in the presence of acid.

For example, an amine group may be protected, for example, as an amide or a urethane, for example, as: a methyl amide ( $-\text{NHCO}-\text{CH}_3$ ); a benzyloxy amide ( $-\text{NHCO}-\text{OCH}_2\text{C}_6\text{H}_5$ ,  $-\text{NH-Cbz}$ ); as a t-butoxy amide ( $-\text{NHCO}-\text{OC}(\text{CH}_3)_3$ ,  $-\text{NH-Boc}$ ); a 2-biphenyl-2-propoxy amide ( $-\text{NHCO}-\text{OC}(\text{CH}_3)_2\text{C}_6\text{H}_4\text{C}_6\text{H}_5$ ,  $-\text{NH-Bpoc}$ ), as a 9-fluorenylmethoxy amide ( $-\text{NH-Fmoc}$ ), as a 6-nitroveratryloxy amide ( $-\text{NH-Nvoc}$ ), as a 2-trimethylsilylethoxy amide ( $-\text{NH-Teoc}$ ), as a 2,2,2-trichloroethoxy amide ( $-\text{NH-Troc}$ ), as an allyloxy amide ( $-\text{NH-Alloc}$ ), as a 2-(phenylsulfonyl)ethoxy amide ( $-\text{NH-Psec}$ ); or, in suitable cases, as an N-oxide ( $>\text{NO}$ ).

For example, a carboxylic acid group may be protected as an ester for example, as: an  $\text{C}_{1-7}$  alkyl ester (e.g. a methyl ester; a t-butyl ester); a  $\text{C}_{1-7}$  haloalkyl ester (e.g. a  $\text{C}_{1-7}$  trihaloalkyl ester); a tri- $\text{C}_{1-7}$  alkylsilyl- $\text{C}_{1-7}$  alkyl ester; or a  $\text{C}_{5-20}$  aryl- $\text{C}_{1-7}$  alkyl ester (e.g. a benzyl ester; a nitrobenzyl ester); or as an amide, for example, as a methyl amide.

For example, a thiol group may be protected as a thioether ( $-\text{SR}$ ), for example, as: a benzyl thioether; an acetamidomethyl ether ( $-\text{S}-\text{CH}_2\text{NHC}(=\text{O})\text{CH}_3$ ).

It may be convenient or desirable to prepare, purify, and/or handle the active compound in the form of a prodrug. The term "prodrug", as used herein, pertains to a compound which, when metabolised (e.g. in vivo), yields the desired active compound. Typically, the prodrug is inactive, or less active than the active compound, but may provide advantageous handling, administration, or metabolic properties.

For example, some prodrugs are esters of the active compound (e.g. a physiologically acceptable metabolically labile ester). During metabolism, the ester group ( $-\text{C}(=\text{O})\text{OR}$ ) is cleaved to yield the active drug. Such esters may be formed by esterification, for example, of any of the carboxylic acid groups ( $-\text{C}(=\text{O})\text{OH}$ ) in the parent compound, with, where appropriate, prior protection of any other reactive groups present in the parent compound, followed by deprotection if required. Examples of such metabolically labile esters include those wherein R is  $\text{C}_{1-20}$  alkyl (e.g. -Me, -Et);  $\text{C}_{1-7}$  aminoalkyl (e.g. aminoethyl; 2-(N,N-diethylamino)ethyl; 2-(4-morpholino)ethyl); and acyloxy- $\text{C}_{1-7}$  alkyl (e.g. acyloxymethyl; acyloxyethyl; e.g. pivaloyloxymethyl; acetoxymethyl; 1-acetoxyethyl; 1-(1-methoxy-1-methyl)ethyl-carboxyloxyethyl; 1-(benzoyloxy)ethyl; isopropoxy-carboxyloxyethyl; 1-isopropoxy-carboxyloxyethyl; cyclohexyl-carboxyloxyethyl; 1-cyclohexyl-carboxyloxyethyl; cyclohexyloxy-carboxyloxyethyl; 1-cyclohexyloxy-carboxyloxyethyl; (4-tetrahydropyranyloxy)carboxyloxyethyl; 1-(4-tetrahydropyranyloxy)carboxyloxyethyl; (4-tetrahydropyranyloxy)carboxyloxyethyl; and 1-(4-tetrahydropyranyloxy)carboxyloxyethyl).

Further suitable prodrug forms include phosphonate and glycolate salts. In particular, hydroxy groups ( $-\text{OH}$ ), can be made into phosphonate prodrugs by reaction with chlorod-

64

ibenzylphosphite, followed by hydrogenation, to form a phosphonate group  $-\text{O}-\text{P}(=\text{O})(\text{OH})_2$ . Such a group can be cleared by phosphatase enzymes during metabolism to yield the active drug with the hydroxy group.

Also, some prodrugs are activated enzymatically to yield the active compound, or a compound which, upon further chemical reaction, yields the active compound. For example, the prodrug may be a sugar derivative or other glycoside conjugate, or may be an amino acid ester derivative.

Use

The present invention provides active compounds, specifically, active in inhibiting the activity of mTOR.

The term "active" as used herein, pertains to compounds which are capable of inhibiting mTOR activity, and specifically includes both compounds with intrinsic activity (drugs) as well as prodrugs of such compounds, which prodrugs may themselves exhibit little or no intrinsic activity.

One assay which may conveniently be used in order to assess the mTOR inhibition offered by a particular compound is described in the examples below.

The present invention further provides a method of inhibiting the activity of mTOR in a cell, comprising contacting said cell with an effective amount of an active compound, preferably in the form of a pharmaceutically acceptable composition. Such a method may be practised in vitro or in vivo.

For example, a sample of cells may be grown in vitro and an active compound brought into contact with said cells, and the effect of the compound on those cells observed. As examples

of "effect", the inhibition of cellular growth in a certain time or the accumulation of cells in the G1 phase of the cell cycle over a certain time may be determined. Where the active compound is found to exert an influence on the cells, this may be used as a prognostic or diagnostic marker of the efficacy of the compound in methods of treating a patient carrying cells of the same cellular type.

The term "treatment", as used herein in the context of treating a condition, pertains generally to treatment and therapy, whether of a human or an animal (e.g. in veterinary applications), in which some desired therapeutic effect is achieved, for example, the inhibition of the progress of the condition, and includes a reduction in the rate of progress, a halt in the rate of progress, amelioration of the condition, and cure of the condition. Treatment as a prophylactic measure (i.e. prophylaxis) is also included.

#### Administration

The active compound or pharmaceutical composition comprising the active compound may be administered to a subject by any convenient route of administration, whether systemically/peripherally or at the site of desired action, including but not limited to, oral (e.g. by ingestion); topical (including e.g. transdermal, intranasal, ocular, buccal, and sublingual); pulmonary (e.g. by inhalation or insufflation therapy using, e.g. an aerosol, e.g. through mouth or nose); rectal; vaginal; parenteral, for example, by injection, including subcutaneous, intradermal, intramuscular, intravenous, intraarterial, intracardiac, intrathecal, intraspinal, intracapsular, subcapsular, intraorbital, intraperitoneal, intratracheal, subcuticular, intraarticular, subarachnoid, and intrasternal; by implant of a depot, for example, subcutaneously or intramuscularly.

The subject may be a eukaryote, an animal, a vertebrate animal, a mammal, a rodent (e.g. a guinea pig, a hamster, a rat, a mouse), murine (e.g. a mouse), canine (e.g. a dog), feline (e.g. a cat), equine (e.g. a horse), a primate, simian (e.g. a monkey or ape), a monkey (e.g. marmoset, baboon), an ape (e.g. gorilla, chimpanzee, orangutang, gibbon), or a human.

#### Formulations

While it is possible for the active compound to be administered alone, it is preferable to present it as a pharmaceutical composition (e.g., formulation) comprising at least one active compound, as defined above, together with one or more pharmaceutically acceptable carriers, adjuvants, excipients, diluents, fillers, buffers, stabilisers, preservatives, lubricants, or other materials well known to those skilled in the art and optionally other therapeutic or prophylactic agents.

Thus, the present invention further provides pharmaceutical compositions, as defined above, and methods of making a pharmaceutical composition comprising admixing at least one active compound, as defined above, together with one or more pharmaceutically acceptable carriers, excipients, buffers, adjuvants, stabilisers, or other materials, as described herein.

The term "pharmaceutically acceptable" as used herein pertains to compounds, materials, compositions, and/or dosage forms which are, within the scope of sound medical judgement, suitable for use in contact with the tissues of a subject (e.g. human) without excessive toxicity, irritation, allergic response, or other problem or complication, commensurate with a reasonable benefit/risk ratio. Each carrier, excipient, etc. must also be "acceptable" in the sense of being compatible with the other ingredients of the formulation.

Suitable carriers, diluents, excipients, etc. can be found in standard pharmaceutical texts. See, for example, refs. 27 to 29.

The formulations may conveniently be presented in unit dosage form and may be prepared by any methods well known in the art of pharmacy. Such methods include the step of bringing into association the active compound with the carrier which constitutes one or more accessory ingredients. In general, the formulations are prepared by uniformly and intimately bringing into association the active compound with liquid carriers or finely divided solid carriers or both, and then if necessary shaping the product.

Formulations may be in the form of liquids, solutions, suspensions, emulsions, elixirs, syrups, tablets, lozenges, granules, powders, capsules, cachets, pills, ampoules, suppositories, pessaries, ointments, gels, pastes, creams, sprays, mists, foams, lotions, oils, boluses, electuaries, or aerosols.

Formulations suitable for oral administration (e.g., by ingestion) may be presented as discrete units such as capsules, cachets or tablets, each containing a predetermined amount of the active compound; as a powder or granules; as a solution or suspension in an aqueous or non-aqueous liquid; or as an oil-in-water liquid emulsion or a water-in-oil liquid emulsion; as a bolus; as an electuary; or as a paste.

A tablet may be made by conventional means, e.g. compression or molding, optionally with one or more accessory ingredients. Compressed tablets may be prepared by compressing in a suitable machine the active compound in a free-flowing form such as a powder or granules, optionally mixed with one or more binders (e.g. povidone, gelatin, acacia, sorbitol, tragacanth, hydroxypropylmethyl cellulose); fillers or diluents (e.g. lactose, microcrystalline cellulose, calcium hydrogen phosphate); lubricants (e.g. magnesium stearate, talc, silica); disintegrants (e.g. sodium starch glycolate, cross-linked povidone, cross-linked sodium carboxymethyl cellulose); surface-active or dispersing or wetting agents (e.g., sodium lauryl sulfate); and preservatives (e.g., methyl p-hydroxybenzoate, propyl p-hydroxybenzoate, sorbic acid). Molded tablets may be made by molding in a suitable machine a mixture of the powdered compound moistened with an inert liquid diluent. The tablets may optionally be coated or scored and may be formulated so as to provide slow or controlled release of the active compound therein using, for example, hydroxypropylmethyl cellulose in varying proportions to provide the desired release profile. Tablets may optionally be provided with an enteric coating, to provide release in parts of the gut other than the stomach.

Formulations suitable for topical administration (e.g. transdermal, intranasal, ocular, buccal, and sublingual) may be formulated as an ointment, cream, suspension, lotion, powder, solution, past, gel, spray, aerosol, or oil. Alternatively, a formulation may comprise a patch or a dressing such as a bandage or adhesive plaster impregnated with active compounds and optionally one or more excipients or diluents.

Formulations suitable for topical administration in the mouth include lozenges comprising the active compound in a flavored basis, usually sucrose and acacia or tragacanth; pastilles comprising the active compound in an inert basis such as gelatin and glycerin, or sucrose and acacia; and mouthwashes comprising the active compound in a suitable liquid carrier.

Formulations suitable for topical administration to the eye also include eye drops wherein the active compound is dissolved or suspended in a suitable carrier, especially an aqueous solvent for the active compound.

Formulations suitable for nasal administration, wherein the carrier is a solid, include a coarse powder having a particle size, for example, in the range of about 20 to about 500 microns which is administered in the manner in which snuff is taken, i.e. by rapid inhalation through the nasal passage from a container of the powder held close up to the nose. Suitable formulations wherein the carrier is a liquid for administration as, for example, nasal spray, nasal drops, or by aerosol administration by nebuliser, include aqueous or oily solutions of the active compound.

Formulations suitable for administration by inhalation include those presented as an aerosol spray from a pressurised pack, with the use of a suitable propellant, such as dichlorodifluoromethane, trichlorofluoromethane, dichloro-tetrafluoroethane, carbon dioxide, or other suitable gases.

Formulations suitable for topical administration via the skin include ointments, creams, and emulsions. When formulated in an ointment, the active compound may optionally be employed with either a paraffinic or a water-miscible ointment base. Alternatively, the active compounds may be for-

mulated in a cream with an oil-in-water cream base. If desired, the aqueous phase of the cream base may include, for example, at least about 30% w/w of a polyhydric alcohol, i.e., an alcohol having two or more hydroxyl groups such as propylene glycol, butane-1,3-diol, mannitol, sorbitol, glycerol and polyethylene glycol and mixtures thereof. The topical formulations may desirably include a compound which enhances absorption or penetration of the active compound through the skin or other affected areas. Examples of such dermal penetration enhancers include dimethylsulfoxide and related analogues.

When formulated as a topical emulsion, the oily phase may optionally comprise merely an emulsifier (otherwise known as an emulgent), or it may comprises a mixture of at least one emulsifier with a fat or an oil or with both a fat and an oil. Preferably, a hydrophilic emulsifier is included together with a lipophilic emulsifier which acts as a stabiliser. It is also preferred to include both an oil and a fat. Together, the emulsifier(s) with or without stabiliser(s) make up the so-called emulsifying wax, and the wax together with the oil and/or fat make up the so-called emulsifying ointment base which forms the oily dispersed phase of the cream formulations.

Suitable emulgents and emulsion stabilisers include Tween 60, Span 80, cetostearyl alcohol, myristyl alcohol, glyceryl monostearate and sodium lauryl sulphate. The choice of suitable oils or fats for the formulation is based on achieving the desired cosmetic properties, since the solubility of the active compound in most oils likely to be used in pharmaceutical emulsion formulations may be very low. Thus the cream should preferably be a non-greasy, non-staining and washable product with suitable consistency to avoid leakage from tubes or other containers. Straight or branched chain, mono- or dibasic alkyl esters such as di-isoadipate, isocetyl stearate, propylene glycol diester of coconut fatty acids, isopropyl myristate, decyl oleate, isopropyl palmitate, butyl stearate, 2-ethylhexyl palmitate or a blend of branched chain esters known as Crodamol CAP may be used, the last three being preferred esters. These may be used alone or in combination depending on the properties required. Alternatively, high melting point lipids such as white soft paraffin and/or liquid paraffin or other mineral oils can be used.

Formulations suitable for rectal administration may be presented as a suppository with a suitable base comprising, for example, cocoa butter or a salicylate.

Formulations suitable for vaginal administration may be presented as pessaries, tampons, creams, gels, pastes, foams or spray formulations containing in addition to the active compound, such carriers as are known in the art to be appropriate.

Formulations suitable for parenteral administration (e.g., by injection, including cutaneous, subcutaneous, intramuscular, intravenous and intradermal), include aqueous and non-aqueous isotonic, pyrogen-free, sterile injection solutions which may contain anti-oxidants, buffers, preservatives, stabilisers, bacteriostats, and solutes which render the formulation isotonic with the blood of the intended recipient; and aqueous and non-aqueous sterile suspensions which may include suspending agents and thickening agents, and liposomes or other microparticulate systems which are designed to target the compound to blood components or one or more organs. Examples of suitable isotonic vehicles for use in such formulations include Sodium Chloride Injection, Ringer's Solution, or Lactated Ringer's Injection. Typically, the concentration of the active compound in the solution is from about 1 ng/ml to about 10 µg/ml, for example from about 10 ng/ml to about 1 µg/ml. The formulations may be presented in unit-dose or multi-dose sealed containers, for example,

ampoules and vials, and may be stored in a freeze-dried (lyophilised) condition requiring only the addition of the sterile liquid carrier, for example water for injections, immediately prior to use. Extemporaneous injection solutions and suspensions may be prepared from sterile powders, granules, and tablets. Formulations may be in the form of liposomes or other microparticulate systems which are designed to target the active compound to blood components or one or more organs.

#### Dosage

It will be appreciated that appropriate dosages of the active compounds, and compositions comprising the active compounds, can vary from patient to patient. Determining the optimal dosage will generally involve the balancing of the level of therapeutic benefit against any risk or deleterious side effects of the treatments of the present invention. The selected dosage level will depend on a variety of factors including, but not limited to, the activity of the particular compound, the route of administration, the time of administration, the rate of excretion of the compound, the duration of the treatment, other drugs, compounds, and/or materials used in combination, and the age, sex, weight, condition, general health, and prior medical history of the patient. The amount of compound and route of administration will ultimately be at the discretion of the physician, although generally the dosage will be to achieve local concentrations at the site of action which achieve the desired effect without causing substantial harmful or deleterious side-effects.

Administration *in vivo* can be effected in one dose, continuously or intermittently (e.g., in divided doses at appropriate intervals) throughout the course of treatment. Methods of determining the most effective means and dosage of administration are well known to those of skill in the art and will vary with the formulation used for therapy, the purpose of the therapy, the target cell being treated, and the subject being treated. Single or multiple administrations can be carried out with the dose level and pattern being selected by the treating physician.

In general, a suitable dose of the active compound is in the range of about 100 µg to about 250 mg per kilogram body weight of the subject per day. Where the active compound is a salt, an ester, prodrug, or the like, the amount administered is calculated on the basis of the parent compound and so the actual weight to be used is increased proportionately.

In addition to their use in therapeutic medicine, the compounds of formula (I) and their pharmaceutically acceptable salts are also useful as pharmacological tools in the development and standardisation of *in vitro* and *in vivo* test systems for the evaluation of the effects of inhibitors of mTor in laboratory animals such as cats, dogs, rabbits, monkeys, rats and mice, as part of the search for new therapeutic agents.

In the above other pharmaceutical composition, process, method, use and medicament manufacture features, the alternative and preferred embodiments of the compounds of the invention described herein also apply.

a) NH<sub>3</sub>, 14 bar; b) (i) SOCl<sub>2</sub>, THF, r.t., (ii) NH<sub>3</sub> c) Oxalyl chloride, Toluene, Δ; d) DIPEA, POCl<sub>3</sub>, Toluene or Anisole, Δ; e) Appropriate amine, diisopropylethylamine, CH<sub>2</sub>Cl<sub>2</sub> or Anisole; f) Appropriate amine, diisopropylethyl amine, DMA, 70° C.;

To the appropriate amino acid (1 equiv) was added liquid ammonia (sufficient to make a 0.6M solution of substrate in ammonia). The suspension was sealed in a pressure vessel which was then heated slowly to 130° C. It was noted that at this temperature a pressure of 18 bar was observed. This temperature and pressure was maintained for a further 16 hours whereupon the mixture was cooled to room temperature. The pressure vessel was opened and the reaction poured into ice cold water (1 reaction volume). The resulting solution was acidified to pH 1-2 using concentrated HCl which caused a precipitate to form. The acidic mixture was allowed to warm to room temperature and was stirred like this for a further 30 min. The suspension was then extracted with diethyl ether (3×400 ml). The combined organic extracts were then filtered and the filtrate concentrated in vacuo to give a white solid which was dried further over P<sub>2</sub>O<sub>5</sub> to give the title compound (typically 80-90% yield and 90%+ pure) in suitably pure form to be used without any further purification.

2-amino-6-chloronicotinic acid —X=N, Y=C, Z=C: (90% yield, 96% purity) m/z (LC-MS, ESP): 173 [M+H]<sup>+</sup> R/T=3.63 min

79

To a 0.3 M solution of amino acid (1 equiv) in anhydrous THF, under an inert atmosphere, was added thionyl chloride (3.3 equiv) in a dropwise fashion. The reaction mixture was stirred at room temperature for 2 hours. After this time the reaction was concentrated in vacuo to give a crude yellow solid residue. The crude solid was dissolved in THF (equal to initial reaction volume) and concentrated in vacuo again to give a yellow solid residue. The residue was dissolved once more in THF and concentrated as before to give a solid residue which was then dissolved in THF (to give a solution of 0.3M) and ammonia gas bubbled through the solution for 1 hour. The resultant precipitate was removed by filtration and the filtrate concentrated in vacuo to give a yellow precipitate which was triturated with water at 50° C. then dried to give the title compound (typically 90-95%) yield and suitably clean enough to be used without any further purification.

2-Amino-6-chloronicotinamide —X=N, Y=C, Z=C: (92% yield, 93% purity) m/z (LC-MS, ESP): 172 [M+H]<sup>+</sup> R/T=3.19 min

To a stirred solution (0.06 M) of substrate (1 equiv) in anhydrous toluene under an inert atmosphere was added oxalyl chloride (1.2 equiv) in a dropwise manner. The resulting mixture was then heated to reflux (115° C.) for 4 hours whereupon it was cooled and stirred for a further 16 hours. The crude reaction mixture was then concentrated to half its volume in vacuo and filtered to give the desired product in suitably pure form to be used without any further purification.

7-Chloro-1H-pyrido[2,3-d]pyrimidine-2,4-dione —X=N, Y=C, Z=C: (95% yield, 96% purity) m/z (LC-MS, ESP): 196 [M-H]<sup>-</sup> R/T=3.22 min

To a stirred 0.5 M suspension of the appropriate dione (1 equiv) in anhydrous toluene under an inert atmosphere was slowly added diisopropylethylamine (3 equiv). The reaction mixture was then heated to 70° C. for 30 minutes and then cooled to room temperature prior to the addition of POCl<sub>3</sub> (3 equiv). The reaction was then heated to 100° C. for 2.5 hours before being cooled and concentrated in vacuo to give a crude slurry which was then suspended in EtOAc and filtered through a thin pad of Celite™. The filtrate was concentrated in vacuo to give a brown, oil which was dissolved in CH<sub>2</sub>Cl<sub>2</sub>

80

and stirred over silica gel for 30 minutes. After this time the silica was removed by filtration, the filtrate concentrated and the crude residue purified by flash chromatography (SiO<sub>2</sub>) to give the title compound in analytically pure form.

2,4,7-Trichloro-pyrido[2,3-d]pyrimidine-X=N, Y=C, Z=C: (48% yield, 96% purity) m/z (LC-MS, ESP): 234 [M+H]<sup>+</sup> R/T=4.21 min

To a cooled (0-5° C.) stirred solution (0.1 M) of the appropriate trichloro-substrate (1 equiv) in CH<sub>2</sub>Cl<sub>2</sub> was added diisopropylethylamine (1 equiv) in a dropwise fashion. The appropriate amine (1 equiv) was then added to the reaction mixture portionwise over the period of 1 hour. The solution was maintained at room temperature with stirring for a further 1 hour before the mixture was washed with water (2x1 reaction volume). The aqueous extracts were combined and extracted with CH<sub>2</sub>Cl<sub>2</sub> (2x1 reaction volume). The organic extracts were then combined, dried (sodium sulphate), filtered and concentrated in vacuo to give an oily residue which solidified upon prolonged drying. The solid was triturated with diethylether and then filtered and the cake washed with cold diethyl ether to leave the title compound in suitable clean form to be used without any further purification.

2,7-Dichloro-4-morpholin-4-yl-pyrido[2,3-d]pyrimidine—R1=morpholine, X=N, Y=C, Z=C: (92% yield, 90% purity) m/z (LC-MS, ESP): 285 [M+H]<sup>+</sup> R/T=3.90 min

2,7-Dichloro-4-((S)-3-methyl-morpholin-4-yl)-pyrido[2,3-d]pyrimidine—R1=(S)-3-Methyl-morpholine, X=N, Y=C, Z=C: (87% yield, 92% purity) m/z (LC-MS, ESP): 301 [M+H]<sup>+</sup> R/T=4.13 min

2,7-Dichloro-4-((R)-3-methyl-morpholin-4-yl)-pyrido[2,3-d]pyrimidine—R1=(R)-3-Methyl-morpholine: (99% yield, 94% purity) m/z (LC-MS, ESP): 301 [M+H]<sup>+</sup> R/T=3.49 min

Alternatively, to a stirred 0.47 M suspension of the appropriate dione (1 equiv) in anhydrous anisole under an inert atmosphere was added POCl<sub>3</sub> (2.6 equiv). The mixture was heated to 55° C. and then diisopropylethylamine (2.6 equiv) was slowly added. The reaction mixture was then heated to 85-90° C. for 30 minutes. Water was added in portions (0.15 equiv), and the reaction mixture was held at 85-90° C. for a further 30 minutes. The reaction was cooled to 50° C., and then 15% of the anisole solvent was removed by vacuum distillation. The mixture was then cooled to -5° C. and diisopropylethylamine (1.1 equiv) was added. A 4.9M solution of the appropriate amine (1.05 equiv) in anisole was then added to the reaction mixture continuously over a period of 1 hour. The solution was then warmed to 30° C. and the reaction monitored by HPLC until reaction completion.

One third of the resulting mixture from the above reaction was then added over 10 min to a stirred mixture of 1.95M aqueous potassium hydroxide (3.9 equiv) and i-butanol (6.9 equiv) at 60° C. The stirring was stopped, the phases were allowed to separate, and the aqueous phase was removed. Stirring was resumed, and 1.95M aqueous potassium hydroxide (3.9 equiv) was added to the retained organic phase. The

## 81

second third of the resulting reaction mixture from the reaction above was then added over 10 min at 60° C. Again, stirring was stopped, the phases were allowed to separate, and the aqueous phase was removed. Stirring was resumed, and 1.95M aqueous potassium hydroxide (3.9 equiv) was added to the retained organic phase. The remaining third of the resulting reaction mixture from the reaction above was then added over 10 min at 60° C. Again, stirring was stopped, the phases were allowed to separate, and the aqueous phase was removed. Water was then added to the organic phase with stirring, and the stirred mixture heated to 75° C. Stirring was stopped, the phases were allowed to separate, and the aqueous phase was removed. The resulting organic phase was stirred and allowed to cool to 30° C., and then as the mixture was heated to 60° C. heptane (11.5 equiv) was added over 20 min when the mixture was around 40° C. After being heated to 60° C., the mixture was cooled over 2.5h to 10° C. After 30 min, the resulting slurry was filtered off, washed with a 10:1 heptane:anisole mixture (2×1.4 equiv) and then washed with heptane (2×1.4 equiv). The solid was then dried in a vacuum oven at 50° C. to leave the title compound in suitable clean form to be used without any further purification.

To a solution (0.2 M) of the appropriate dichloro-substrate (1 equiv) in anhydrous dimethyl acetamide under an inert atmosphere was added diisopropylethylamine (1 equiv) followed by the appropriate amine (1 equiv). The resulting mixture was heated for 48 hours at 70° C. before being cooled to ambient temperature. The reaction was diluted with CH<sub>2</sub>Cl<sub>2</sub> (1 reaction volume) and then washed with water (3×1 reaction volumes). The organic extract was concentrated in vacuo to give a syrup which was dissolved in EtOAc (1 reaction volume) and washed with saturated brine solution before being dried (sodium sulphate) and concentrated in vacuo to give an oil. The crude residue was purified by flash chromatography (SiO<sub>2</sub>, eluted with EtOAc:Hex (7:3) going to (1:1)) to give the title compound as a yellow solid that was suitably clean to be used without any further purification.

The reaction vessel was sealed and the mixture exposed to microwave radiation (140° C., medium absorption setting) for 30 minutes. Upon completion the samples were filtered through a silica cartridge, washed with EtOAc and then concentrated in

The appropriate 7-chloropyridopyrimidine was reacted with 2-methoxy-5-(4,4,5,5-tetramethyl-1,3,2-dioxaborolan-2-yl)-benzoic acid methyl ester according to conditions E to give 2-methoxy-5-[4-((S)-3-methyl-morpholin-4-yl)-2-thio-morpholin-4-yl-pyrido[2,3-d]pyrimidin-7-yl]-benzoic acid methyl ester as the desired product (1 equiv) which was then diluted in MeOH to give a 0.03M solution. NaOH (5 equiv of 1 M solution) was then added and the resultant mixture stirred at room temperature for 5 days. After this time the reaction was filtered and neutralized with 1M HCl before being concentrated in vacuo to give a crude yellow residue which was diluted in CH<sub>2</sub>Cl<sub>2</sub>. The mixture was filtered and the resulting filtrate concentrated to give the desired product as an oil.

Upon completion, addition of ammonia was stopped and the mixture concentrated in vacuo to give a yellow oily residue which was dissolved in CH<sub>2</sub>Cl<sub>2</sub> (1 reaction volume) and washed with water (2x1 reaction volume). To a 0.3M solution of 5-[2,4-bis(S)-3-methyl-morpholin-4-yl]-pyrido[2,3-d]pyrimidin-7-yl]-1H-indazol-3-ylamine (example 1d) (1 equiv) in EtOH was added hydrazine hydrate (5 equiv). The mixture was refluxed for 90 minutes whereupon it was cooled and partitioned between CH<sub>2</sub>Cl<sub>2</sub> and water (1 reaction volume of each). The organic extract was removed. The aqueous phase was further extracted with CH<sub>2</sub>Cl<sub>2</sub> (2x1 reaction volume). The combined organic extracts were then dried (MgSO<sub>4</sub>), filtered and concentrated in vacuo to give a yellow slurry which was further purified by flash chromatography (SiO<sub>2</sub>) using EtOAc/Hexanes as eluent to give the title compound as a yellow powder.

To a solution (0.2 M) of the appropriate chloro-substrate (1 equiv) in dioxane was added diisopropylethylamine (2 equiv). To this mixture was then added the appropriate amine (2 equiv). The reaction was then heated under the influence of microwave radiation (120° C., medium absorption setting) for 10 minutes. Upon completion the sample was concentrated in vacuo and the resulting residue dissolved in CH<sub>2</sub>Cl<sub>2</sub> and washed with H<sub>2</sub>O. The organic fraction was removed, dried (MgSO<sub>4</sub>). The crude residue was purified by flash chromatography (SiO<sub>2</sub>) to give the desired products.

To a solution of the appropriate 7-substituted-1H-pteridine-2,4-dione (1 equiv) in anhydrous toluene (sufficient to make a 0.1 M solution) was added Hunig's base (3 equiv). A reflux condenser was attached to the reaction vessel and the mixture heated, under an inert atmosphere) to 70° C. for 30 minutes. After this time, the reaction was cooled to 40° C. whereupon POCl<sub>3</sub> (3 equiv) was added. The mixture was then heated, with stirring, to 110° C. for 3 hrs. Upon completion, the reaction was cooled and concentrated in vacuo to give a tarry residue which was dissolved in the minimum volume of CH<sub>2</sub>Cl<sub>2</sub> and filtered through a thick silica pad. The resulting

After approx 10 minutes Hunig's base was added (1 equiv) and the resultant mixture stirred at -5° C. for 30 minutes. After this time, the reaction was allowed to warm to room temperature, whereupon the appropriate amine (1 equiv=R2) and Hunig's base (1 equiv) were then added. The resultant mixture was heated to 60° C. and maintained at this temperature, with stirring, for 16 hours. Upon completion, the mixture was allowed to cool to room temperature before being purified by preparative HPLC to give the desired product.

## Comparative Example 1

Using the method of Example 1, to a cooled (0-5° C.) stirred solution (0.1 M) of the appropriate trichloro substrate (1 equiv) in CH<sub>2</sub>Cl<sub>2</sub> was added diisopropylethylamine (1 equiv) in a dropwise fashion. The appropriate amine (1 equiv) was then added to the reaction mixture portionwise over the period of 1 hour. The solution was maintained at room temperature with stirring for a further 1 hour before the mixture was washed with water (2x1 reaction volume). The aqueous extracts were combined and extracted with CH<sub>2</sub>Cl<sub>2</sub> (2x1 reaction volume). The organic extracts were then combined, dried (sodium sulphate), filtered and concentrated in vacuo to give an oily residue which solidified upon prolonged drying. The solid was triturated with diethylether and then filtered and the cake washed with cold diethyl ether to leave the title compound in a suitably clean form to be used without any further purification.

## Biological Assay

For mTOR enzyme activity assays, mTOR protein was isolated from HeLa cell cytoplasmic extract by immunoprecipitation, and activity determined essentially as described previously using recombinant PHAS-1 as a substrate (ref 21).

Examples 1a-1l, 1ak, 1al, 1ap, 1at, m/z, 3l, 4a, 4c, 4d, 4f, 4i, 4w, 4x, 5q were tested and exhibited IC<sub>50</sub> values against mTOR of less than 200 nM. For example 5q was measured to have an IC<sub>50</sub> of 46 nM.

The comparative Examples were also tested and when compared to the corresponding Examples, the exhibited IC<sub>50</sub> values for the Comparative Examples were higher than those of the corresponding Examples (ie IC<sub>50</sub> Comparative Example 1a > IC<sub>50</sub> Example 1a). For example Example 1k was measured to have an IC<sub>50</sub> of 5 nM whereas Comparative Example 1k was measured to have an IC<sub>50</sub> of 33 nM. Therefore, compounds of the present invention are more active in the mTOR assay.

## Example 23

## Alternative Enzyme Assay

The assay used AlphaScreen technology (Gray et al., Analytical Biochemistry, 2003, 313: 234-245) to determine the ability of test compounds to inhibit phosphorylation by recombinant mTOR.

A C-terminal truncation of mTOR encompassing amino acid residues 1362 to 2549 of mTOR (EMBL Accession No. L34075) was stably expressed as a FLAG-tagged fusion in HEK293 cells as described by Vilella-Bach et al., Journal of Biochemistry, 1999, 274, 4266-4272. The HEK293 FLAG-tagged mTOR (1362-2549) stable cell line was routinely maintained at 37° C. with 5% CO<sub>2</sub> up to a confluency of 70-90% in Dulbecco's modified Eagle's growth medium (DMEM; Invitrogen Limited, Paisley, UK Catalogue No. 41966-029) containing 10% heat-inactivated foetal calf serum (FCS; Sigma, Poole, Dorset, UK, Catalogue No. F0392), 1% L-glutamine (Gibco, Catalogue No. 25030-024) and 2 mg/ml Geneticin (G418 sulphate; Invitrogen Limited, UK Catalogue No. 10131-027). Following expression in the mammalian HEK293 cell line, expressed protein was purified using the FLAG epitope tag using standard purification techniques.

20

Test compounds were prepared as 10 mM stock solutions in DMSO and diluted into water as required to give a range of final assay concentrations. Aliquots (2 µl) of each compound dilution were placed into a well of a Greiner 384-well low volume (LV) white polystyrene plate (Greiner Bio-one). A 10 µl mixture of recombinant purified mTOR enzyme, 1 µM biotinylated peptide substrate (Biotin-Ahx-Lys-Lys-Ala-Asn-Gln-Val-Phe-Leu-Gly-Phe-Thr-Tyr-Val-Ala-Pro-Ser-Val-Leu-Glu-Ser-Val-Lys-Glu-NH<sub>2</sub>; Bachem UK Ltd), ATP (20 µM) in a buffer solution [comprising Tris-HCl pH7.4 buffer (50 mM), EGTA (0.1 mM), bovine serum albumin (0.5 mg/ml), DTT (1.25 mM) and manganese chloride (10 mM)] were added to the assay plates and incubated with compound for 2 hours at room temperature.

Each reaction was stopped by the addition of 5 µl of a mixture of EDTA (50 mM), bovine serum albumin (BSA; 0.5 mg/ml) and Tris-HCl pH7.4 buffer (50 mM) containing p70 S6 Kinase (T389) 1A5 Monoclonal Antibody (Cell Signalling Technology, Catalogue No. 9206B) and AlphaScreen Streptavidin donor and Protein A acceptor beads (200 ng/well Perkin Elmer, Catalogue No. 6760002B and 6760137R respectively). Assay plates were left for approx 16 hours at room temperature before measurement. The resultant signals arising from laser light excitation at 680 nm were measured using a Packard Envision instrument. Phosphorylated biotinylated peptide is formed in situ as a result of mTOR mediated phosphorylation. The phosphorylated biotinylated peptide that is associated with AlphaScreen Streptavidin donor beads forms a complex with the p70 S6 Kinase (T389) 1A5 Monoclonal Antibody that is associated with Alphascreen Protein A acceptor beads. Upon laser light excitation at 680 nm, the donor bead:acceptor bead complex produces a signal that can be measured. Accordingly, the presence of mTOR kinase activity results in an assay signal. In the presence of an mTOR kinase inhibitor, signal strength is reduced.

Control wells that produced a maximum signal corresponding to maximum enzyme activity were created by using 5% DMSO instead of test compound. Control wells that produced a minimum signal corresponding to fully inhibited enzyme were created by adding EDTA (83 mM) instead of test compound.

mTOR enzyme inhibition for a given test compound was expressed as an IC<sub>50</sub> value.

The compounds tested in this assay exhibited IC<sub>50</sub> values against mTOR of less than 40 µM.

##### Cell Proliferation Assay ( $GI_{50}$ )

Cell growth was assessed using the sulforhodamine B (SRB) assay (A). T47D (ECACC, 85102201) cells were routinely passaged in RPMI (Invitrogen, 42401018) plus 10% foetal calf serum (FCS), 1% L-glutamine (Gibco BRL, 25030) to a confluence not greater than 80%. To undertake the assay, T47D cells were seeded at  $2.5 \times 10^3$  cells/well in 90  $\mu$ L RPMI plus 10% foetal calf serum, 1% L-glutamine in 96 well plates (Costar, 3904) and incubated at 37° C. (+5%  $CO_2$ ) in a humidified incubator. Once the cells had fully adhered (typically following 4-5 hours incubation) the plate was removed from the incubator and 10  $\mu$ L of the diluent added to the control wells (A1-12 and B1-12). Compound was prepared in a six point semi-log dilution at 10 $\times$  the final concentration required e.g. for a 6 point range of 30  $\mu$ M to 100 nM in semi-log steps dilution started at 300  $\mu$ M in stock plate. Dosing was completed by addition of 10  $\mu$ L of compound at highest concentration to C1-12 through to the lowest concentration in H1-12. The plates were then incubated for 120 hours prior to SRB analysis.

386

Upon completion of incubation, media was removed and the cells fixed with 100  $\mu$ L of ice cold 10% (w/v) trichloroacetic acid. The plates were incubated at 4° C. for 20 minutes and then washed four times with water. Each well of cells was then stained with 100  $\mu$ L of 0.4% (w/v) SRB (Sulforhodamine B, Sigma, Poole, Dorset, UK, Catalogue number S-9012) in 1% acetic acid for 20 minutes before washing four times with 1% acetic acid. Plates were then dried for 2 hours at room temperature. The dye from the stained cells was solubilized by the addition of 100  $\mu$ L of 10 mM Tris Base into each well. Plates were gently shaken and left at room temperature for 30 minutes before measuring the optical density at 564 nm on a Microquant microtiter plate reader. The concentration of inhibitor eliciting a 50% reduction in growth ( $GI_{50}$ ) was determined by analysis of staining intensity of the treated cells as a percentage of the vehicle control wells using Excellfit software.

Examples 1a-1l were tested and exhibited  $GI_{50}$  values of less than 300 nM.

The Comparative Examples were also tested and when compared to the corresponding Examples, the exhibited  $GI_{50}$  values for the Comparative Examples were higher than those of the corresponding Examples (ie  $GI_{50}$  Comparative Example 1a >  $GI_{50}$  Example 1a). For example Example 1k was measured to have an  $GI_{50}$  of 32 nm whereas Comparative Example 1k was measured to have an  $GI_{50}$  of 268 nm. Therefore, compounds of the present invention are more active in reducing cell growth.

##### In Vitro Phospho-Ser473 Akt Assay

This assay determines the ability of test compounds to inhibit phosphorylation of Serine 473 in Akt as assessed using Acumen Explorer technology (Acumen Bioscience Limited), a plate reader that can be used to rapidly quantitate features of images generated by laser-scanning

A MDA-MB-468 human breast adenocarcinoma cell line (LGC Promochem, Teddington, Middlesex, UK, Catalogue No. HTB-132) was routinely maintained at 37° C. with 5%  $CO_2$  up to a confluency of 70-90% in DMEM containing 10% heat-inactivated FCS and 1% L-glutamine.

For the assay, the cells were detached from the culture flask using 'Accutase' (Innovative Cell Technologies Inc., San Diego, Calif., USA; Catalogue No. AT104) using standard tissue culture methods and resuspended in media to give  $1.7 \times 10^5$  cells per ml. Aliquots (90  $\mu$ L) were seeded into each of the inner 60 wells of a black Packard 96 well plate (PerkinElmer, Boston, Mass., USA; Catalogue No. 6005182) to give a density of ~15000 cells per well. Aliquots (90  $\mu$ L) of culture media were placed in the outer wells to prevent edge effects. The cells were incubated overnight at 37° C. with 5%  $CO_2$  to allow them to adhere.

On day 2, the cells were treated with test compounds and incubated for 2 hours at 37° C. with 5%  $CO_2$ . Test compounds were prepared as 10 mM stock solutions in DMSO and serially diluted as required with growth media to give a range of concentrations that were 10-fold the required final test concentrations. Aliquots (10  $\mu$ L) of each compound dilution were placed in a well (in triplicate) to give the final required concentrations. As a minimum response control, each plate con-

tained wells having a final concentration of 100  $\mu$ M LY294002 (Calbiochem, Beeston, UK, Catalogue No. 440202). As a maximum response control, wells contained 1% DMSO instead of test compound. Following incubation, the contents of the plates were fixed by treatment with a 1.6% aqueous formaldehyde solution (Sigma, Poole, Dorset, UK, Catalogue No. F1635) at room temperature for 1 hour.

All subsequent aspiration and wash steps were carried out using a Tecan 96 well plate washer (aspiration speed 10 mm/sec). The fixing solution was removed and the contents of the plates were washed with phosphate-buffered saline (PBS; 50  $\mu$ l; Gibco, Catalogue No. 10010015). The contents of the plates were treated for 10 minutes at room temperature with an aliquot (50  $\mu$ l) of a cell permeabilisation buffer consisting of a mixture of PBS and 0.5% Tween-20. The 'permeabilisation' buffer was removed and non-specific binding sites were blocked by treatment for 1 hour at room temperature of an aliquot (50  $\mu$ l) of a blocking buffer consisting of 5% dried skimmed milk ['Marvel' (registered trade mark); Premier Beverages, Stafford, GB] in a mixture of PBS and 0.05% Tween-20. The 'blocking' buffer was removed and the cells were incubated for 1 hour at room temperature with rabbit anti phospho-Akt (Ser473) antibody solution (50  $\mu$ l per well; Cell Signalling, Hitchin, Herts, U.K., Catalogue No 9277) that had been diluted 1:500 in 'blocking' buffer. Cells were washed three times in a mixture of PBS and 0.05% Tween-20. Subsequently, cells were incubated for 1 hour at room temperature with Alexafluor488 labelled goat anti-rabbit IgG (50  $\mu$ l per well; Molecular Probes, Invitrogen Limited, Paisley, UK, Catalogue No. A11008) that had been diluted 1:500 in 'blocking' buffer. Cells were washed 3 times with a mixture of PBS and 0.05% Tween-20. An aliquot of PBS (50  $\mu$ l) was added to each well and the plates were sealed with black plate sealers and the fluorescence signal was detected and analysed.

Fluorescence dose response data obtained with each compound were analysed and the degree of inhibition of Serine 473 in Akt was expressed as an  $IC_{50}$  value.
